Description of two new aberrations of Hemiptera

by
W. H. GRAVESTEIN

Fam ANTHOCORIDAE.

Anthocoris confusus Reut. ab. **aterrimus** nov. ab.

Descriptio: *Corio atro, apice macula rotunda fulva. Antennis pedibusque totis nigris.*

Diagnosis: Corium all black, with a somewhat brownish round macula at the inner part of the end. Antennae and legs black with tops of femora dark brown. In all other respects the same as the type.

One specimen was taken by myself with some of the type at Geulem (Limburg), 21-VI-1946.

Fam. LYGAEIDAE.

Gastrodes grossipes Deg. ab. **funebris** nov. ab.

Descriptio: *Pronotum nigrum, angulis posterioribus fuscis. Corium atrum, fulvomarginatum. Membrana nigra.*

Diagnosis: Pronotum all black, except the brown hind-edges. Corium black with brown margins. Membrane all black.

One specimen was taken by myself at De Koog (Texel) in the same locality as the type on Pinus sylvestris.
